Vaginitis

• Bacterial Vaginosis (BV)
• Vulvovaginal Candidiasis (VVC)
• Trichomoniasis

Vaginal Environment

• The vagina is a dynamic ecosystem that contains approximately 10^9 bacterial colony-forming units.
• Normal vaginal discharge is clear to white, odorless, and of high viscosity.
• Normal bacterial flora is dominated by lactobacilli – other potential pathogens present.
• Lactic acid helps to maintain a normal vaginal pH of 3.8 to 4.2.
• Acidic environment and other host immune factors inhibit the overgrowth of bacteria.
• Some lactobacilli also produce H_2O_2, a potent microbicide.

Vaginitis

• Usually characterized by
  – Vaginal discharge
  – Vulvar itching
  – Irritation
  – Odor
• Common types
  – Bacterial vaginosis (40%–45%)
  – Vulvovaginal candidiasis (20%–25%)
  – Trichomoniasis (15%–20%)
Other Causes of Vaginitis

- Normal physiologic variation
- Allergic reactions
- Herpes simplex virus
- Mucopurulent cervicitis
- Atrophic vaginitis
- Vulvar vestibulitis
- Foreign bodies
- Desquamative inflammatory vaginitis

Diagnosis of Vaginitis

- Patient history
- Visual inspection of internal/external genitalia
- Appearance of discharge

Preparation and Evaluation of Specimen

- Collection of specimen
- Preparation of specimen slide
- Examination of specimen slide
  - NaCl (wet mount)
  - KOH (wet mount)
- Whiff test
- Vaginal pH
Slide 7

Wet Prep: Common Characteristics

- RBCs
- Squamous epithelial cell
- PMN
- Sperm
- Artifacts

Slide 9

Other Diagnostic Aids for Vaginitis Evaluation

- Culture
- DNA probe
- Rapid test
- Nucleic acid amplification tests (NAAT)

- Other tests
  - PIP activity
  - BVBlue
  - PCR assay

Vaginitis Curriculum
## Vaginitis Differentiation

### Vaginitis

- **Bacterial Vaginosis (BV)**

## Learning Objectives

Upon completion of this content, the learner will be able to:

- Describe the epidemiology of bacterial vaginosis in the U.S.
- Describe the pathogenesis of bacterial vaginosis.
- Describe the clinical manifestations of bacterial vaginosis.
- Identify common methods used in the diagnosis of bacterial vaginosis.
- List CDC-recommended treatment regimens for bacterial vaginosis.
- Describe patient follow-up and partner management for patients with bacterial vaginosis.
- Summarize appropriate prevention counseling messages for patients with bacterial vaginosis.
Lesson I: Epidemiology: Disease in the U.S.

- Most common cause of vaginitis
- Prevalence varies by population
  - 5%-25% among college students
  - 12%-61% among STD patients
- Widely distributed
Slide 16

**Epidemiology (continued)**

- BV linked to
  - Premature rupture of membranes
  - Premature delivery and low birth-weight delivery
  - Acquisition of HIV, *N. gonorrhoeae*, *C. trachomatis*, and HSV-2
  - Development of PID
  - Post-operative infections after gynecological procedures
  - Recurrence of BV

Slide 17

**Risk Factors**

- African American
- Two or more sex partners in previous six months/new sex partner
- Douching
- Lack of barrier protection
- Absence of or decrease in lactobacilli
- Lack of H₂O₂-producing lactobacilli

Slide 18

**Transmission**

- Currently not considered a sexually transmitted disease, but acquisition appears to be related to sexual activity.
Lesson II: Pathogenesis

Microbiology
- Overgrowth of bacteria species normally present in vagina with anaerobic bacteria
- BV correlates with a decrease or loss of protective lactobacilli
  - Vaginal acid pH normally maintained by lactobacilli through metabolism of glycogen.
  - Hydrogen peroxide ($H_2O_2$) is produced by some Lactobacilli spp.
  - $H_2O_2$ helps maintain a low pH, which inhibits bacteria overgrowth.
  - Loss of protective lactobacilli may lead to BV.

H$_2$O$_2$ -Producing Lactobacilli
- All lactobacilli produce lactic acid.
- Some species also produce $H_2O_2$.
- $H_2O_2$ is a potent natural microbicidal.
- Present in 42%–74% of females.
- In vitro, $H_2O_2$ is toxic to viruses such as HIV, as well as bacteria.
Lesson III: Clinical Manifestations

Clinical Presentation and Symptoms

- Many women (50%–60%) are asymptomatic.
- Signs/symptoms, when present
  - Reported malodorous (fishy smelling) vaginal discharge
  - Reported more commonly after vaginal intercourse and after completion of menses
- Symptoms may remit spontaneously.

Lesson IV: Diagnosis
Slide 25

**Wet Prep: Bacterial Vaginosis**

- Saline: 40X objective

**Clue cells**

**NOT a clue cell**

*Source: Seattle STD/HIV Prevention Training Center at the University of Washington*

---

Slide 26

**BV Diagnosis: Amsel Criteria**

Amsel Criteria:

Must have at least three of the following findings:

- Vaginal pH > 4.5
- Presence of >20% per HPF of "clue cells" on wet mount examination
- Positive amine or "whiff" test
- Homogeneous, non-viscous, milky-white discharge adherent to the vaginal walls

---

Slide 27

**Other Diagnostic Tools**

- Vaginal Gram stain (Nugent or Speigel criteria)
- Culture
- DNA probe
- Newer diagnostic modalities include
  - PIP activity
  - Sialidase tests
Lesson V: Patient Management

Bacterial Vaginosis Curriculum

---

Treatment

CDC-recommended regimens
- Metronidazole 500 mg orally twice a day for 7 days
- Metronidazole gel 0.75%, one full applicator (5 g) intravaginally, once or twice a day for 5 days
- Clindamycin cream 2%, one full applicator (5 g) intravaginally at bedtime for 7 days

---

Treatment (continued)

Alternative regimens (nonpregnant)
- Tinidazole 2 g orally once daily for 2 days, or
- Tinidazole 1 g orally once daily for 5 days, or
- Clindamycin 300 mg orally twice a day for 7 days, or
- Clindamycin ovules 100 g intravaginally once at bedtime for 3 days

Multiple recurrences
- Twice weekly metronidazole gel for 4–6 months may reduce recurrences
- Oral nitroimidazole followed by intravaginal boric acid and suppressive metronidazole gel
Treatment in Pregnancy

- Pregnant women with symptomatic disease should be treated with one of the following recommended regimens:
  - Metronidazole 500 mg twice a day for 7 days, or
  - Metronidazole 250 mg orally 3 times a day for 7 days, or
  - Clindamycin 300 mg orally twice a day for 7 days

- Insufficient evidence to assess impact of screening for BV in asymptomatic high-risk women (those who have previously delivered a premature infant)

Screening and Treatment

- Treatment is recommended for women with symptoms.
- Therapy is not recommended for male or female sex partners of women with BV.
- Treatment of BV in women prior to surgical abortion or hysterectomy may be considered.

Treatments Not Recommended

- Ampicillin
- Erythromycin
- Iodine
- Dienestrol cream
- Tetracycline/doxycycline
- Triple sulfa
- Ciprofloxacin
Recurrence

- Recurrence rate is 20% to 40% one month after therapy.
- Recurrence may be a result of persistence of BV-associated organisms and failure of lactobacillus flora to recolonize.
- Data do not support yogurt therapy or exogenous oral lactobacillus treatment.
- Under study: vaginal suppositories containing human lactobacillus strains.
- Twice weekly metronidazole gel for 4–6 months may reduce recurrence.
- Limited data suggest that oral nitroimidazole followed by intravaginal boric acid and suppressive metronidazole gel might be a treatment option after multiple occurrences.

Lesson VI: Prevention

Partner Management

- Relapse or recurrence is not affected by treatment of sex partner(s).
- Routine treatment of sex partners is not recommended.
Patient Counseling and Education

- Nature of the disease
  - Normal vs. abnormal discharge, malodor, BV signs and symptoms
- Transmission issues
  - Association with sexual activity, high concordance in female same-sex partnerships
- Risk reduction
  - Correct and consistent condom use
  - Avoid douching
  - Limit number of sex partners

Vaginitis

Vulvovaginal Candidiasis (VVC)

Learning Objectives

Upon completion of this content, the learner will be able to:
- Describe the epidemiology of candidiasis in the U.S.
- Describe the pathogenesis of candidiasis.
- Identify common methods used in the diagnosis of candidiasis.
- List CDC-recommended treatment regimens for candidiasis.
- Describe patient follow-up and partner management for candidiasis.
- Summarize appropriate prevention counseling messages for patients with candidiasis.
Lessons

I. Epidemiology: Disease in the U.S.
II. Pathogenesis
III. Clinical manifestations
IV. Diagnosis
V. Patient management
VI. Prevention

Lesson I: Epidemiology: Disease in the U.S.

VVC Epidemiology
- Affects most females during lifetime, with approximately 50% having two or more episodes
- Most cases caused by C. albicans (85%–90%)
- Second most common cause of vaginitis
- Estimated cost: $1 billion annually in the U.S.
Transmission

• Candida species are normal flora of skin and vagina and are not considered to be sexually transmitted pathogens.

Lesson II: Pathogenesis

Microbiology

• Candida species are normal flora of the skin and vagina.
• VVC is caused by overgrowth of C. albicans and other non-albicans species.
• Yeast grows as oval budding yeast cells or as a chain of cells (pseudohyphae).
• Symptomatic clinical infection occurs with excessive growth of yeast.
• Disruption of normal vaginal ecology or host immunity can predispose to vaginal yeast infections.
Lesson III: Clinical Manifestations

Clinical Presentation and Symptoms

- Vulvar pruritis is most common symptom.
- Thick, white, curdy vaginal discharge ("cottage cheese-like")
- Erythema, irritation, occasional erythematous "satellite" lesion
- External dysuria and dyspareunia

Vulvovaginal Candidiasis

Source: Health Canada, Sexual Health and STI Section, Clinical Slide Gallery
Lesson IV: Candidiasis

Diagnosis

- History, signs and symptoms
- Visualization of pseudohyphae (mycelia) and/or budding yeast (conidia) on KOH or saline wet prep
- pH normal (4.0 to 4.5)
  - If pH > 4.5, consider concurrent BV or trichomoniasis infection
- Cultures not useful for routine diagnosis

PMNs and Yeast Pseudohyphae

Slide 54

**Lesson V: Patient Management**
Classification of VVC

Uncomplicated VVC
- Sporadic or infrequent vulvovaginal candidiasis
- Mild-to-moderate vulvovaginal candidiasis
- Likely to be C. albicans
- Vulvovaginal candidiasis in nonimmunocompromised women

Complicated VVC
- Recurrent vulvovaginal candidiasis (RVVC)
- Severe vulvovaginal candidiasis
- Non-albicans candidiasis
- Vulvovaginal candidiasis in women with uncontrolled diabetes, debilitation, or immunosuppression

Uncomplicated VVC
- Mild to moderate signs and symptoms
- Nonrecurrent
- 75% of women have at least one episode
- Responds to short course regimen

CDC-Recommended Treatment Regimens for Uncomplicated VVC

Over-the-Counter Intravaginal Agents
- Butoconazole 2% cream, 5 g intravaginally for 3 days
- Clotrimazole 1% cream 5 g intravaginally for 7-14 days
- Clotrimazole 2% cream 5 g intravaginally for 3 days
- Miconazole 2% cream 5 g intravaginally for 7 days
- Miconazole 4% cream 5 g intravaginally for 3 days
- Miconazole 100 mg vaginal suppository, 1 suppository for 7 days
- Miconazole 200 mg vaginal suppository, 1 suppository for 3 days
- Miconazole 1,200 mg vaginal suppository, 1 suppository for 1 day
- Tioconazole 6% ointment 5 g intravaginally in a single application

Prescription Intravaginal Agents
- Nystatin 100,000 unit vaginal tablet, 1 tablet for 14 days
- Terconazole 0.4% cream 5 g intravaginally for 7 days
- Terconazole 0.8% cream 5 g intravaginally for 3 days
- Terconazole 80 mg vaginal suppository, 1 suppository for 3 days

Prescription Oral Agents
- Fluconazole 150 mg oral tablet, 1 tablet in a single dose
Complicated VVC

• Recurrent (RVVC)
  – Four or more episodes in one year

• Severe
  – Edema
  – Excoriation/Fissure formation

• Non-albicans candidiasis

• Compromised host

Complicated VVC Treatment

• Recurrent VVC (RVVC)
  – 7–14 days of topical therapy, or
  – 100 mg, 150 mg, or 200 mg oral dose of fluconazole repeated every 3 days (days 1, 4, and 7)
  – Maintenance regimens (see 2010 CDC STD treatment guidelines)

• Severe VVC
  – 7–14 days of topical therapy, or
  – 150 mg oral dose of fluconazole repeated in 72 hours

Complicated VVC Treatment (continued)

• Non-albicans
  – Optimal treatment unknown
  – 7–14 days non-fluconazole therapy
  – 600 mg boric acid in gelatin capsule vaginally once a day for 14 days for recurrences

• Compromised host
  – 7–14 days of topical therapy

• Pregnancy
  – Fluconazole is contraindicated
  – 7-day topical agents are recommended
Lesson VI: Prevention

Partner Management

- VVC is not usually acquired through sexual intercourse.
- Treatment of sex partners is not recommended.
- A minority of male sex partners may have balanitis and may benefit from treatment with topical antifungal agents to relieve symptoms.

Patient Counseling and Education

- Nature of the disease
  - Normal vs. abnormal vaginal discharge, signs and symptoms of candidiasis, maintain normal vaginal flora
- Transmission Issues
  - Not sexually transmitted
- Risk reduction
  - Avoid douching, avoid unnecessary antibiotic use, complete course of treatment
Vaginitis
Trichomonas vaginalis

Learning Objectives
Upon completion of this content, the learner will be able to:
• Describe the epidemiology of trichomoniasis in the United States.
• Describe the pathogenesis of T. vaginalis.
• Describe the clinical manifestations of trichomoniasis.
• Identify common methods used in the diagnosis of trichomoniasis.
• List CDC-recommended treatment regimens for trichomoniasis.
• Describe patient follow-up and partner management for trichomoniasis.
• Describe appropriate prevention counseling messages for patients with trichomoniasis.

Lessons
I. Epidemiology: Disease in the U.S.
II. Pathogenesis
III. Clinical manifestations
IV. Diagnosis
V. Patient management
VI. Prevention
Lesson I: Epidemiology: Disease in the U.S.

Trichomoniasis

Incidence and Prevalence

- Most prevalent nonviral STI
- Estimated one million cases annually in the U.S. at a medical cost of $24 million
- Estimated prevalence:
  - 3% in the general female population
  - 1.3% in non-Hispanic white women
  - 1.8% in Mexican American women
  - 13.3% in non-Hispanic black women
  - 40%–60% in female prison inmates and commercial sex workers
  - 18%–50% in females with vaginal complaints

Trichomoniasis and Other Vaginal Infections—Women—Initial Visits to Physicians’ Offices, United States, 1966–2011

NOTE: The relative standard errors for trichomoniasis estimates range from 16% to 27% and for other vaginitis estimates range from 8% to 13%.

Risk Factors
• Multiple sexual partners
• Lower socioeconomic status
• History of STDs
• Lack of condom use

Transmission
• Almost always sexually transmitted.
• Females and males may be asymptomatic.
• Transmission between female sex partners has been documented.

Lesson II: Pathogenesis
Microbiology

- Etiologic agent
  - *Trichomonas vaginalis* is a single-celled, flagellated, anaerobic protozoan parasite.
  - Only protozoan that infects the genital tract.
- Associations with
  - Preterm rupture of membranes and preterm delivery.
  - Increased risk of HIV acquisition and transmission.

Trichomoniasis

Lesson III: Clinical Manifestations
Clinical Presentation and Symptoms in Women

- May be asymptomatic approximately 70% of the time
- Vaginitis
  - Frothy gray or yellow-green vaginal discharge
  - Pruritus
- Cervical petechiae ("strawberry cervix") - classic presentation, occurring in <2% of cases
- May also infect Skene’s glands and urethra, where the organisms may not be susceptible to topical therapy
- Trichomoniasis has been associated with increased shedding of HIV in HIV-infected women

"Strawberry cervix" due to *T. vaginalis*

Source: Claire E. Stevens/Seattle STD/HIV Prevention Training Center at the University of Washington

Clinical Presentation and Symptoms in Men

- Usually asymptomatic
- May cause 11%–13% of infected males to present with nongonococcal urethritis (NGU)
Lesson IV: Diagnosis

Diagnosis in Females

- Motile trichomonads seen on saline wet mount
- Vaginal pH >4.5 often present
- Culture has been the “gold standard”
- Pap smear sensitivity with traditional cytology poor, but enhanced by use of liquid-based testing
- DNA probe
- Rapid test (antigen detection test, OSOM)
- NAAT (urine or vaginal swab)

Diagnosis in Males

- Culture testing of urethral swab, urine, or semen NAATs
- Sex partners of women diagnosed with T. vaginalis should also be treated regardless of initial testing
Wet Prep: Trichomoniasis

Saline: 40X objective

*Trichomonas shown for size reference only; must be motile for identification

Source: Mark D. Plikaytis, M.D., Ph.D., Public Health, University of Washington

Lesson V: Patient Management

Treatment

- CDC-recommended regimen
  - Metronidazole 2 g orally in a single dose or
  - Tinidazole 2 g orally in a single dose

- CDC-recommended alternative regimen
  - Metronidazole 500 mg twice a day for 7 days
Pregnancy

- CDC-recommended regimen
  - Metronidazole 2 g orally in a single dose
- All symptomatic pregnant women should be treated, regardless of pregnancy stage.

Treatment Failure

- A common reason for treatment failure is reinfection. Therefore, it is critical to assure treatment of all sex partners at the same time.

- If treatment failure occurs with metronidazole 2 g orally in a single dose for all partners, treat with metronidazole 500 mg orally twice daily for 7 days or tinidazole 2 g orally single dose.

- If treatment failure of either of these regimens, consider retreatment with tinidazole or metronidazole 2 g orally once a day for 5 days.

- If repeated treatment failures occur, contact the Division of STD Prevention, CDC, for metronidazole susceptibility testing (telephone: 404-718-4141, website: www.cdc.gov/std).
Partner Management

- Sex partners should be treated.
- Patients should be instructed to avoid sex until they and their sex partners are cured (when therapy has been completed and patient and partner(s) are asymptomatic, about 7 days).

Patient Counseling and Education

- **Nature of the disease**
  - May be asymptomatic in both men and women, in women may persist for months to years, untreated trichomoniasis might be associated with adverse pregnancy outcomes, douching may worsen vaginal discharge, alcohol consumption is contraindicated with metronidazole
- **Transmission issues**
  - Almost always sexually transmitted, fomite transmission rare, might be associated with increased susceptibility to HIV acquisition

Risk Reduction

The clinician should
- Assess patient’s potential for behavior change.
- Discuss individualized risk-reduction plans with the patient.
- Discuss prevention strategies such as abstinence, monogamy, use of condoms, and limiting the number of sex partners.
- Latex condoms, when used consistently and correctly, can reduce the risk of transmission of the T. vaginalis parasite.
History

Tanya Walters
- 24-year-old single female
- Presents with complaints of a smelly, yellow vaginal discharge and slight dysuria for one week
- Denies vulvar itching, pelvic pain, or fever
- Two sex partners during the past year—did not use condoms with these partners—on oral contraceptives for birth control
- No history of sexually transmitted diseases, except for trichomoniasis one year ago
- Last check-up one year ago

Physical Exam
- Vital signs: blood pressure 112/78, pulse 72, respiration 15, temperature 37.3°C
- Cooperative, good historian
- Chest, heart, breast, musculoskeletal, and abdominal exams within normal limits
- No flank pain on percussion
- Normal external genitalia with a few excoriations near the introitus, but no other lesions
- Speculum exam reveals a moderate amount of frothy, yellowish, malodorous discharge, without visible cervical mucopus or easily induced cervical bleeding
- Bimanual examination was normal without uterine or adnexal tenderness
Questions
1. What is your differential diagnosis based on history and physical examination?
2. Based on the differential diagnosis of vaginitis, what is the etiology?
3. Which laboratory tests should be offered or performed?

Case Study
___________________________________
___________________________________
___________________________________
___________________________________
___________________________________
___________________________________
___________________________________

Laboratory Results
• Vaginal pH: 6.0
• Saline wet mount of vaginal secretions: numerous motile trichomonads and no clue cells
• KOH wet mount: negative for budding yeast and pseudohyphae
4. What may one reasonably conclude about Tanya’s diagnosis?
5. What is the appropriate CDC-recommended first-line treatment for this patient?

Case Study

Partner Management
Jamie
• Last sexual contact: 2 days ago
• First sexual contact: 2 months ago
• Twice a week, vaginal sex
6. How should Jamie and Calvin be managed?

Calvin
• Last sexual contact: 6 months ago
• First sexual contact: 7 months ago
• 3 times a week, vaginal and oral sex
Tanya was prescribed metronidazole 2 g orally, and was instructed to abstain from sexual intercourse until her current partner was treated.

She returned two weeks later, she reported taking her medication, but had persistent vaginal discharge that had not subsided with treatment. She reported abstinence since her clinic visit, and her partner had moved out of the area. Her tests for other STDs (including chlamydia and gonorrhea) were negative.

The vaginal wet mount again revealed motile trichomonads.

7. What is the appropriate therapy for Tanya now?
8. What are appropriate prevention and counseling messages for Tanya?
